

# TANK BOOSTER *PRO*

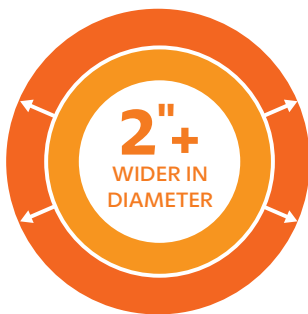

## Having to downsize your water heater due to NAECA?

With the NAECA (National Appliance Energy Conservation Act) regulations that have gone into effect as of April 16, 2015, new energy efficiency standards are mandated on all residential water heaters. These standards impacted the size of water heaters and space restrictions.

- The same water heater you have now could increase in both diameter and height by 2".
- For installations where space is an issue, like in closets or multifamily housing, a smaller capacity water heater is necessary.
- This means replacement water heaters will have less capacity and not be able to provide enough hot water.

*In these scenarios the Tank Booster Pro is the perfect solution which will increase the usable hot water capacity by up to 100%!*

For example, the diameter of a new unit that has the same gallon capacity as an existing unit may be two or more inches wider.

In addition, the height of a new unit with the same gallon capacity as an existing unit may be two or more inches taller.
